Item 6 (b) of the provisional agenda\*\*

**Implementation of and follow-up to major United Nations conferences and summits: review and coordination of the implementation of the Programme of Action for the Least Developed Countries for the Decade 2001-2010**

## Implementation of the Programme of Action for the Least Developed Countries for the Decade 2001-2010

### Report of the Secretary-General

#### *Summary*

The fifth results-oriented annual progress report shows continued strong economic performance by least developed countries, with fewer countries, mainly Pacific islands, lagging behind. Social indicators are also improving, but overall socio-economic progress in African least developed countries has been significantly compromised by continuing population growth driven by the highest fertility in the world. International support for health is paying dividends in African least developed countries, but malnutrition appears to be worsening, particularly in rural areas where agriculture can hardly keep up with rapid population growth, environmental degradation and challenges associated with climate change. As a result, African least developed countries increasingly face food shortages, disruption of food supplies and famine.

---

\* A/62/50.

\*\* E/2007/100.

Achieving the objectives of the Brussels Programme of Action requires greater donor focus on enhancing the productive capacity of least developed countries particularly in agriculture. Donors should also increase allocation of aid to physical infrastructure and technological development to increase the productivity and competitiveness of least developed countries. Above all, donors need to make significant efforts to increase their aid volumes in order to achieve the internationally agreed goals of 0.15 to 0.20 per cent of their gross national income as official development assistance to least developed countries by 2010 and improve aid effectiveness (ownership, harmonization, alignment, results and mutual accountability) as agreed in Rome and Paris.

Strong commitment by least developed countries and their development partners to the objectives, goals and targets of the Programme and full adherence to the principles of country ownership, an integrated approach, result-orientation, genuine partnership and market considerations in its implementation are crucial to further progress.

## I. Introduction

1. The present report is submitted pursuant to Economic and Social Council resolution 2006/41 and General Assembly resolution 61/211 in which the Secretary-General was requested to submit an annual analytical and results-oriented progress report on the further implementation of the Programme of Action of Least Developed Countries for the Decade 2001-2010.

2. The report assesses the implementation of the Programme of Action by measuring progress made by least developed countries and development partners towards achieving 30 international development goals and the targets contained therein. To the extent possible, it also provides information about the implementation of commitments: measures adopted by least developed countries and their development partners aimed at achieving the objectives, goals and targets of the Programme of Action.

3. As in the past, the report follows the structure of the Programme of Action and contains a statistical annex with country data. All sources are provided at the bottom of each table.

4. As for graduation, in the 2006 triennial review (E/2006/33), the Committee for Development Policy recommended that Papua New Guinea be included in and Samoa be graduated from the list of least developed countries. However, in its decision 2006/266, the Council, upon the request of the Government of Papua New Guinea,<sup>1</sup> decided to defer consideration of the Committee recommendation on Papua New Guinea to its substantive session of 2007. Furthermore, in its decision 2007/212, the Council also requested that the Committee examine the issues raised by Samoa and submit its report and recommendation to the Council (see E/2007/12). The same review also found Equatorial Guinea, Kiribati, Tuvalu and Vanuatu eligible for graduation for the first time. In accordance with the established procedures, they will be considered for graduation at the next triennial review.

## II. Implementation of the Programme of Action

### Commitment 1

#### Fostering a people-centred policy framework

5. The overarching objective of the Brussels Declaration and Programme of Action for the Least Developed Countries for the Decade 2001-2010 is to halve the proportion of people living in extreme poverty and hunger by 2015 and promote sustainable development of least developed countries through significant and steady economic growth. To this end, it set targets of at least 7 per cent annual gross domestic product (GDP) growth and a 25 per cent ratio of investment to GDP per annum for least developed countries.

6. Remarkably, in 2005, 30 least developed countries met or were on track to the 7 per cent growth target, compared to 24 in the period 2000 to 2004, and the number of countries experiencing negative growth declined from five from 2000 to 2004 to two in 2005. At the regional level, the African least developed countries easily met or were close to the 7 per cent growth target, while the Asian least developed

---

<sup>1</sup> Inclusion in the list of least developed countries is subject to a country's acceptance.

countries accelerated modestly and the Pacific island least developed countries slipped from slow to near-zero growth during the period from 1995 to 2005. However, fast growth in African least developed countries has been seriously compromised by rapid population growth, while the economies of Asian least developed countries grew at a rate almost three times greater than did their populations, and the countries were able to benefit even from modest economic growth.

7. In 2005, 30 least developed countries achieved or were on track to reach the target of a 25 per cent ratio of investment to GDP, compared to 25 during the period from 2003 to 2004. However, the number of least developed countries with low ratios increased from 9 in 2003/2004 to 11 in 2005.

8. The latest data for a limited number of least developed countries suggests significant declines in the extreme poverty rate since 1990 in a greater number of least developed countries than previously reported. If confirmed and sustained in other least developed countries, these trends could serve as the first indication of a reversal of the increases in extreme poverty in least developed countries observed over the last two decades.

9. Fewer least developed countries than last year are making significant progress towards the goal of halving the proportion of people suffering from hunger as a result of low agricultural productivity and recurrent natural disasters, but in an increasing number of least developed countries, undernourishment is relatively moderate.

10. Pro-poor growth and poverty reduction have been integrated into national poverty reduction strategies and poverty reduction strategy papers of least developed countries. As of 31 January 2007, 36 least developed countries had participated in the Poverty Reduction Strategy Paper process. Seven of them had interim poverty reduction strategy papers and 22 had prepared their first poverty reduction strategy papers. Seven other least developed countries have prepared their second poverty reduction strategy papers and Burkina Faso submitted its first progress report on the implementation of its second poverty reduction strategy paper.

11. Consistent with the 2005 World Summit Outcome (General Assembly resolution 60/1) in which world leaders resolved to adopt, by 2006, and implement comprehensive national development strategies to achieve the internationally agreed development goals and objectives, including the Millennium Development Goals, at least 4 least developed countries have been completing their national development strategies and 18 least developed countries have been refining their poverty reduction strategy papers with a view to achieving international development goals. Another 25 least developed countries, including 15 in Africa, are at the initial stage of this process and completing their needs assessment, with the support of the United Nations Development Programme. Four least developed countries (Cape Verde, Mozambique, Rwanda and the United Republic of Tanzania) are among the first eight pilot countries for the One United Nations programme, which aims to ensure greater coherence and effectiveness of United Nations development efforts at the country level.

## **Commitment 2**

### **Good governance at the national and international levels**

12. The Brussels Programme of Action underscores the critical importance of good governance at the national and international levels for achieving its objectives, goals and targets. Although the least developed countries have made substantial efforts to improve governance, the challenges that remain are still enormous (see <http://www.un.org/ohrlls>).

13. Analysis of *Worldwide Governance Indicators 2006*, the most comprehensive source of aggregate indicators for measuring governance,<sup>2</sup> shows that political stability and non-violence, the rule of law and control of corruption have been improving, but performance on voice and accountability and government effectiveness has been weakening in least developed countries since 1996. In 2005, Bhutan, Kiribati, Samoa, Tuvalu and Vanuatu scored highest among the least developed countries on political stability and the rule of law. The same countries, minus Bhutan, scored the highest on voice and accountability, while Bhutan scored the highest among all least developed countries on control of corruption. All least developed countries had very low scores in regulatory quality and government effectiveness. Overall, compared to other groups of countries, least developed countries performed slightly better than low-income countries in 2005, but worse than lower middle-income countries and significantly worse than upper-middle-income countries.

14. In 2005, 46 least developed countries were eligible for external lending from the International Development Association. The Country Policy and Institutional Assessment (CPIA) rating of good governance performance is the major determinant in the allocation of interest-free credits and Association grants to eligible countries. It measures economic and social policies aimed at promotion of growth and poverty reduction on a scale from one (weak) to six (strong). The 2005 CPIA rating shows that least developed countries scored 3.4 on economic management (macroeconomic, fiscal policy and debt policy); 3.3 on structural policies (trade, financial sector, business regulatory environment); 3.2 on policies for social inclusion/equity; and 3.0 on public sector management and institutions (property rights and rule-based government, quality of budget and finance management, efficiency of revenue mobilization, quality of public administration, transparency and accountability and corruption in public sector).

15. The average Association country performance rating of least developed countries, derived from their overall CPIA and portfolio performance (development project and programme management), shows that 11 out of 46 least developed countries eligible for Association grants demonstrated strong (above 3.5) governance performance in 2005, but the remaining 35 had weak (below 3.5) governance performance for the same year. Very strong (above five) governance performance was demonstrated only by Bhutan and Samoa. By comparison, 9 out of 43 least developed countries eligible for an Association grant<sup>3</sup> demonstrated strong

---

<sup>2</sup> The indicators, derived from 276 variables, are drawn from 31 sources and 25 organizations. They measure good governance performance on the scale from -2.5 to 2.5 in the following six areas: (a) voice and accountability; (b) political stability and absence of violence; (c) government effectiveness; (d) regulatory quality; (e) rule of law; and (f) control of corruption. For more information, see [info.worldbank.org/wbi/governance](http://info.worldbank.org/wbi/governance).

<sup>3</sup> Afghanistan, Liberia, Myanmar, Somali and Timor-Leste were not rated in 2004 CPIA exercise.

governance performance and 34 least developed countries had weak governance performance in the 2004 CPIA rating. In the 2003 rating, 8 out of 43 least developed countries eligible for an Association grant demonstrated strong governance performance and 35 least developed countries had weak governance performance.<sup>4</sup> This suggests steady but very slow progress by least developed countries.

16. Poor governance (weak legal and regulatory framework, weak institutions, lack of transparency and accountability, checks and balances, etc.) often results in corruption, which can take the form of misuse of public office for private gain. Corruption, in turn, leads to the depletion of domestic resources, deters new investments, causes public services to deteriorate, leads to economic stagnation and, ultimately, exacerbates poverty and human suffering.

17. Since corruption leaves no paper trail and takes many forms (rent seeking, graft, bribery, extortion, cronyism, nepotism, patronage, embezzlement, kickbacks, etc.), perceptions of corruption based on individual experience are sometimes the only source of information. The Kaufmann-Kraay Control of Corruption Index and the Transparency International Corruption Perception Index provide the most comprehensive tools for measuring corruption. The 2006 Transparency International Index rating on a scale from ten (very clean) to zero (very corrupt) shows that eight out of ten of the worst performers are least developed countries. Even the least developed countries with the best results score below three. Bhutan is the only least developed country which scores relatively high (six). The Kaufman-Kraay Index, which measures control of corruption on a scale from -2.5 to +2.5, with a higher score indicating a higher degree of control of corruption, shows that except for Bhutan (0.69), all 34 least developed countries included in the rating scored well below zero.

18. More than half of least developed countries adopted at least one reform in 2006 in order to improve their business climate. Several least developed countries have adopted significant reforms, including Tanzania, which introduced reforms in four areas (starting a business, registering property, protecting investors and cross-border trade), thereby joining the list of top world reformers. However, compared to other categories of countries, least developed countries were the most difficult countries in which to do business. All 10 world bottom performers in that category in 2006 were least developed countries, except one.<sup>5</sup>

19. Many least developed countries undertook measures and adopted policies in order to attract foreign investments. As of October 2005, 40 least developed countries had established national Investment Promotion Agencies to promote foreign direct investment, and 28 least developed countries joined the World Association of Investment Promotion Agencies, with a view to networking and sharing experience related to foreign direct investment. While most of the agencies established by least developed countries are focused on disseminating information about their countries as favourable locations for foreign direct investment, some assist foreign investors with the preparation of pre-investment feasibility studies and environmental impact assessments as part of their investment promotion package.

---

<sup>4</sup> 2003 CPIA and country performance rating for IDA 12 and 2003 CPIA and country performance rating for IDA 12 were disclosed on a quintile basis. In 2004, CPIA rating methodology was revised. Accordingly, the 2003 CPIA data was also revised to ensure comparability of the scores across years.

<sup>5</sup> *Doing Business in 2007: How to Reform* (World Bank, 2006).

Other agencies (those of Madagascar and the Sudan) serve as one-stop shops that establish rules and regulations for foreign direct investment, approve projects and facilitate the entry of foreign firms by assisting foreign investors in obtaining licences and registration, dealing with local and provincial governments, joint venture partners, suppliers, tax and customs authorities and line ministries. Several agencies also provide project implementation and post-investment services to ensure that foreign investors who have already entered will stay and expand, either in the same industry or another one.

20. To avoid the resource curse of the past, when windfall revenues from natural resources exploitation often increased poverty and fuelled conflicts, some least developed countries have joined the two major global transparency initiatives: the Extractive industries transparency initiative, for transparency in the use of revenues from natural resources, and the Kimberley Process Certification Scheme for the prevention of conflict diamond production.

21. As of January 2007, ten natural resource-rich least developed countries had endorsed the Extractive industries transparency initiative principles and pledged to adhere to them: to publish regularly all payments by companies and all material revenues received by the Government in a form which is accessible and comprehensible to the public; to make all payments and revenues subject to credible, independent audit, consistent with international standards; to have a credible, independent administration reconcile payments and revenues in a manner consistent with international standards; to engage civil society in the design, implementation, monitoring and review of the Extractive industries transparency initiative process; and to develop a public and financially sustainable workplan with measurable targets. Some least developed countries have set up multi-stakeholder committees and developed workplans, but only Guinea has published its revenues. No least developed country has yet published a report or held a review, as required by the Extractive industries transparency initiative.

22. With the support of international partners, Liberia has established a National Diamond Task Force and the Liberian Diamond Authority in order to regain full control of diamond extraction and trade, and has expressed interest in joining the Kimberley process. In April 2007, the Security Council recognized that Liberia met the minimum requirements for joining the Kimberley process and unanimously adopted a resolution in which it noted the progress made by Liberia and lifted the ban on diamond exports (see Security Council resolution 1743 (2007)).

23. As of November 2006, 10 least developed countries were participating in the Kimberley process and 2 least developed countries (Cape Verde and Mali) were in the process of accession to it. The latest triennial review of the process concluded that while a significant number of diamond-producing and trading centres were operating within the Kimberley process, illicit diamond extraction and trading by rebel factions and militias continued in the Democratic Republic of the Congo.

24. Some least developed countries have also adopted fiscal policies and taken measures to cushion the impact of large windfall revenues on inflation and to prevent Dutch disease. Thus, Chad established the Future Generations Fund, a savings mechanism which by December 2005 had accumulated about \$36 million. Timor-Leste established the Petroleum Fund to ensure transparency in the use of oil and gas revenues.

**Commitment 3**  
**Building human and institutional capacities**

25. In 2005, the total population of the least developed countries reached 767 million people, up 12.9 per cent from 2000. The rapid population growth rate was driven by the highest fertility in the world. It is projected that at the current fertility rate the population of least developed countries could surpass 2.7 billion by 2050, and would still double, reaching as high as 1.7 billion, at a reduced fertility rate.

26. A large proportion of children and a very small proportion of older persons mean that least developed countries have the youngest populations in the world, with a median age of 19 years old. Among them, Mali, Niger and Uganda, have populations whose median age is at or below 16 years. It is estimated that by 2050, the median age will reach about 28 and children will account for 29 per cent of the total population, while older persons will account for 10 per cent of the population in least developed countries.

27. A high overall dependency ratio as a result of this population structure could increase extreme poverty, but could also provide a demographic window of opportunity for least developed countries by increasing the economic support ratio (the number of effective producers per effective consumer) and improve the standard of living. However, this scenario can work only if jobs are created for the additional workforce and Governments pursue reproductive policies aimed at reducing fertility (see E/CN.9/2007/3). Two thirds of least developed countries report that such policies are in place.<sup>6</sup>

28. Life expectancy at birth in least developed countries is increasing, but remains the lowest (51 years) in the world. Worse, in 10 African least developed countries, life expectancy is declining. High under-five mortality rates (45 per cent) among children and low mortality rates (16 per cent) among persons aged 65 and over suggest that the least developed countries are still in the early stage of the epidemiological transition when, due to improved hygiene, nutrition and treatment of diseases, child deaths are being shifted to older people. This largely explains low life expectancy in least developed countries. Extreme poverty, malnutrition, HIV/AIDS, tuberculosis, malaria and civil conflicts are also contributing factors.

29. As a result of better prevention and treatment policies, an increasing number of least developed countries (24 in 2005, as compared to 16 in 2004) has either met or is making substantial progress towards the goal of reducing the under-five mortality rate by 2015. Yet in the remaining least developed countries there has been minimal or no progress, and five least developed countries have strong negative trends. The number of countries with very high estimated infant mortality rates has also continued to fall, from 20 in 2004 to 18 in 2005. However, significant increases in infant mortality rates were reported in four least developed countries in 2005.

30. Estimates based on the latest available data show that only five least developed countries are close to achieving the target for reduction of maternal mortality by 2015. In the remaining 45 least developed countries, the maternal mortality ratios are currently too high for this target to be met. New estimates expected later in 2007

---

<sup>6</sup> *World Population Policies 2005* (United Nations publication, Sales No. E.06.XIII.5).

are likely to confirm the general overall severity of the situation in the sub-Saharan African countries, where maternal mortality has been extraordinarily high.

31. Access to and completion of primary education play a crucial role in empowering poor people. Based on the revised data for the period 2002-2004, 27 least developed countries are on track or making rapid progress towards the goal of universal primary enrolment, up from 22, a figure based on earlier data covering fewer countries. The number of countries making slow progress has also declined from seven, based on earlier data, to six based on revised data for 2002-2004. However, for 16 of 17 other countries for which trend data is lacking, current general levels of development suggest that they will be unable to achieve the goal.

32. The Gender Parity Index, defined as the ratio of female to male enrolment rates, shows that in 2005, the ratio of female to male enrolment in primary education was 0.89 per cent, but in secondary and tertiary education it was 0.79 per cent and 0.63 per cent respectively. The Gender Parity Index in adult literacy was 0.72 per cent, suggesting that in 2005, fewer than three women for every four men in least developed countries were literate. Maldives is the only least developed country which has gender parity in adult literacy, while Lesotho has in fact surpassed the target, reporting more literate women than men in 2005.

33. Adult literacy in least developed countries as a whole has improved, but remains the lowest (53 per cent) in the world. It ranges from 19 per cent in Mali to 99 per cent in Samoa. In three out of four countries for which data is available, the rates are still below 70 per cent, and 13 least developed countries report that more than half of their adult population is illiterate. Six least developed countries have literacy rates below 30 per cent.

34. Most least developed countries have achieved or are on track to achieve the target on access to improved water supply in urban areas, but only 28 least developed countries have achieved or are on track to achieve this target in rural areas.

35. Twenty-eight least developed countries are on track to achieve the sanitation target in urban areas, up from 26 in 2002, but little progress is observed in the remaining least developed countries. Worse, the situation in rural areas appears to be deteriorating, as the number of least developed countries which were on track to the sanitation target dropped from 16 in 2002 to 10 in 2004.

36. Declines in HIV/AIDS incidence as a result of effective prevention measures were registered in 2005 in three fifths of least developed countries for which data is available. Rates above 4 per cent are estimated in seven least developed countries compared to 16 in 2003. Yet in seven African and two Asian least developed countries incidence of HIV is increasing.

37. Half of the 30 least developed countries which have trend data for 1990-2003 report a marked improvement in malaria prevalence, but another half report deterioration as well as an increase in malaria deaths. High prevalence occurs mainly in Southern and South-Eastern Asian least developed countries, and in African least developed countries, while most deaths occur in African least developed countries, notably among children. Extremely high numbers of deaths are found in 10 countries and high numbers of deaths in 9 countries.

38. Progress in the use of treated mosquito nets for prevention continues to lag, with only six least developed countries reporting 10 per cent or more children sleeping under treated mosquito nets and about half of least developed countries for which data is available reporting less than 5 per cent of children sleeping under treated mosquito nets. Treatment with anti-malarial drugs is much more widespread, with most least developed countries reporting their use by children with fever in the past two years.

39. Tuberculosis prevalence and death rates have declined substantially in some least developed countries, especially in high-burden countries.<sup>7</sup> Prevalence has declined to under 100 per 100,000 in four countries compared to 6 in 2003, and only six countries in 2005 have rates over 600 per 100,000 compared to 12 in 2003. However, progress from 1990 to 2003 has been difficult to sustain, as an increasing number of countries report relatively high levels of tuberculosis prevalence and death rates in 2003-2005. As HIV rates begin to decline, tuberculosis rates are also expected to fall, as their co-infection has been high.

40. Treatment of tuberculosis under the directly observed short course strategy continues to make good progress, with 17 least developed countries achieving the treatment target in 2004, and an additional 14 on track to achieve. However, case detection is lagging in least developed countries with fewer countries achieving or on track to the target in 2005 than was the case in 2003.

#### **Commitment 4**

#### **Building productive capacities to make globalization work for the least developed countries**

41. Globalization has opened unprecedented opportunities for the movement of goods, services and people. Yet the 50 least developed countries have failed to reap its benefits, mainly due to the structural weaknesses of their economies and lack of capacities related to sustained growth and sustainable development, particularly productive capacities.<sup>8</sup> As a result, least developed countries have been further marginalized in the mainstream development process.

42. According to a United Nations Conference on Trade and Development study,<sup>9</sup> the production structure of least developed countries remains strongly oriented towards exploitation of natural resources without forward or backward linkages to the rest of the economy. While exports of manufactures are increasing, they are limited to the export of low-skilled, labour-intensive, low-technology and, hence, low value-added products, such as garments. Services, although expanding, are mostly in low value-added petty trade and commercial services.

43. Although the share of value-added activities in industry and services in the GDP has been increasing, agriculture remains the backbone of the economy in least developed countries. Some least developed countries have an abundance of land, while others have a shortage, and a significant proportion of the population of these countries survives on fragile lands, with serious constraints for intensive agriculture.

---

<sup>7</sup> According to WHO, 22 high-burden countries represent 80 per cent of the global burden of tuberculosis.

<sup>8</sup> Productive capacities are defined by UNCTAD as “productive resources, entrepreneurial capabilities and production linkages which together determine the capacity of a country to produce goods and services and enable it to grow and develop”. The Least Developed Countries Report 2006. UNCTAD/LDC/2006, Sales No. E.06.II.D.9.

<sup>9</sup> Ibid.

Nonetheless, a common feature of many least developed countries is severe underutilization of land resources and extremely low land productivity due to insufficient investment in agriculture, particularly in irrigation, as well as low modern inputs, particularly fertilizers, and unequal access to land, even in the land-abundant least developed countries.

44. Inadequate infrastructure is a major barrier to development of the productive capacities of least developed countries. The latest available data on roads show increases over the period from 1999 to 2003 in the number of least developed countries with 15 per cent or more of roads paved (23 countries compared to 15), but little or no change is observed in the overall length of roads since 1990. Fourteen least developed countries show increases greater than 20 per cent, but in most (24 of 38 with data), the increase has been less than 20 per cent, or negative since 1990. Railway lengths are low in most least developed countries and only seven have lengths over 1,000 kilometres. Moreover, existing railways are underused: only five least developed countries registered freight over 400 thousand km-tons. According to the latest data, for the period from 1990 to 2004, which covers 33 least developed countries, the number of countries with an increase of more than 2 per cent in aircraft departures was seven, while in the remaining 26 least developed countries, there were increases of 2 per cent or less, or declines. Significant transport of air freight (10 million ton-kms or more) is reported in only eight least developed countries out of 31 least developed countries for which data is available.

45. Only 14 per cent of African and 21 per cent of Asian least developed countries population has access to electricity. Although electric power consumption per capita in least developed countries has increased steadily since 2000 and reached 112 kWh per capita in 2003, an abysmal gap remains between least developed countries and the rest of the world, where the consumption was 2,510 kWh per capita. Energy use in least developed countries has also been increasing since 2000, reaching 306 kg of oil equivalent per capita in 2003. However, this level is far lower than that of the rest of the world (1,734 kg of oil equivalent per capita) during the same period. Charcoal and firewood remain the main energy sources for least developed countries.

46. In 2005, only three least developed countries met the target of five telephone lines per 100 population and two more were on track to meet it by 2010. These were mainly small island least developed countries which achieved high tele-density as a result of liberalization of the telecommunication sector and attraction of foreign investments in facilities upgrades and network expansion, in response to increased tourist demand. However, the number of least developed countries with more than two lines per 100 people, a minimal level of service, remained at 12 in 2005. With less than two main lines per 100, very few of the remaining 32 countries have any prospect of meeting the 2010 target.

47. Due to long waiting periods, the number of fixed telephones grew slowly, albeit steadily in least developed countries (two additional lines per 100 inhabitants annually), while the number of cellular subscribers in least developed countries has increased by a factor almost 21 since 2000. Twenty-eight least developed countries had reached five main lines and cellular subscribers combined per one hundred population in 2005, compared to eighteen countries in 2003-2004. Ongoing expansion is strong but short of the target in 13 least developed countries and minimal in 3 least developed countries.

48. Mobile phones overtook fixed phones in least developed countries due to their easy availability, especially in rural areas, the introduction of prepaid cards, short message services and the reduction of phone call charges as a result of competition. According to the International Telecommunication Union, competition in cellular, Internet access and Very Small Aperture Terminal was authorized in 80 per cent of least developed countries. By comparison, competition in basic services was authorized in just over 40 per cent of least developed countries. The most expensive charges for cellular mobile phone calls were registered in Myanmar and Uganda.

49. The number of Internet users per 100 population has grown considerably since 2000, but there appears to be no significant or at least measurable change from 2004 to 2005 in most least developed countries. In fact, in 2005, more than half of least developed countries had Internet penetration below one per 100.

#### **Commitment 5** **Enhancing the role of trade in development**

50. The share of least developed countries in world exports, in value terms, increased from 0.68 per cent in 2004 to 0.79 per cent in 2005, but this increase was entirely due to oil exports. If oil exports are not counted, the share of least developed countries exports in world merchandise exports in 2005 remained at exactly the same level (0.36 per cent) as in 2004. Exports from least developed countries grew much faster (36 per cent) than those of the rest of the world (14 per cent) in 2005, and faster than their own imports (21 per cent), but there was significant variance from country to country. Thus, exports of five oil exporters (Angola, Chad, Equatorial Guinea, Sudan and Yemen) continued to grow rapidly, reaching 58 per cent in 2005. Exports of manufacturing least developed countries also grew rapidly, but stalled at 17 per cent, a figure reached in 2004. Export growth of commodity producers slowed to 14 per cent, the lowest rate since 2002. Two least developed countries (Lesotho and Madagascar) among exporters of manufacturers and seven least developed countries among exporters of commodities (Burkina Faso, Comoros, the Gambia, Maldives, Sao Tome and Principe, Togo and Tuvalu) experienced negative export growth in 2005.

51. Apart from Bangladesh and Cambodia, least developed countries exports in clothing and textiles decreased 5 per cent annually from 2004 to 2006. The sharpest (14 per cent) drop in clothing and textile exports took place in 2005, the year when the quota regime under the World Trade Organization Agreement on Textile and Clothing (ATC) was terminated. While some least developed countries began to show signs of recovery, there is a danger that others endowed with natural resources and lured by high commodity prices will lose interest in diversifying in textiles and clothing and eventually lose ground in that area.

52. As in 2004, 79 per cent of all imports from least developed countries, not counting arms and oil, were admitted duty-free to the markets of developed countries in 2005, an increase of only 1 per cent since 1996.

53. The utilization rate of the Generalized System of Preferences by least developed countries ranged widely (from 40 to 100 per cent), depending on the importing country and the sector, but was about 70 per cent on average, largely due to the supply side constraints of least developed countries.

**Table 1**  
**Proportion of total developed-country imports from developing countries and least developed countries admitted free of duty, 1996-2005**  
(Percentage)

	1996	1997	1998	1999	2000	2001	2002	2003	2004	2005

*Source:* Calculations prepared by the International Trade Centre, United Nations Conference on Trade and Development and World Trade Organization.

54. In 2005, China, India and Brazil announced duty-free access to their markets for products from least developed countries. Overall, only 72.2 per cent of least developed countries exports enter developing country markets duty-free, due to high tariffs and high tariff escalation in developing countries. Duty-free market access to China for least developed countries exports appears higher (93.3 per cent) but when oil is excluded, it is only 48.4 per cent. In 2005, China announced new market measures favouring least developed countries. It is estimated that these measures will result in the increase of duty-free exports of least developed countries to 95.2 per cent, or, if oil is excluded, 62.3 per cent (see WT/COMTD/LDC/W/38).

55. Tariffs of developed countries on imports from least developed countries have declined modestly in the last 10 years. Average tariffs on textiles have fallen by more than 50 per cent, while average tariffs on clothing and agricultural products, strategically important to least developed countries, decreased much less in the same period.

**Table 2**  
**Developed countries' average tariffs on imports of key products from developing countries, 1996-2004**  
(Percentage)

56. In August 2006, 42 least developed countries were at different stages of the integrated framework, aimed at assisting least developed countries in mainstreaming trade in their national development strategies and poverty reduction strategy papers. Twenty had validated their Diagnostic Trade Integrated Studies and identified their priorities, 11 had started the Diagnostic Trade Integrated Studies Process, 6 held technical reviews and 5 submitted their requests for inclusion in the programme.

57. A more effective, enhanced integrated framework<sup>10</sup> will begin at the end of 2007. The estimated funding for the enhanced integrated framework is US\$ 400 million (approximately US\$ 8 million per country over five years), including US\$ 77 million for tier I (core function support costs) and US\$ 320 million for tier II (action matrix implementation support costs). This represents a tenfold increase in financial resources to the integrated framework. Although there have been no formal pledges to the enhanced integrated framework, the integrated framework saw an increase in pledges at the end of 2006 from some \$35 million to almost \$52 million, while cumulative contributions rose from approximately \$34 million to approximately \$49.5 million.

### **Commitment 6**

#### **Reducing vulnerability and protecting the environment**

58. With almost 72 per cent of population living in rural areas and dependent on income from agriculture, least developed countries are highly susceptible to land degradation, drought, desertification, deforestation, water and air pollution and climate change.

59. Thus, 36 out of 41 least developed countries for which data is available suffer from moderate (5-10 per cent) to very severe (50-100 per cent) human-induced land degradation. The severest (over 70 per cent) land degradation is in Burundi and Rwanda, countries with high population densities. Ten out of 30 of the world's lowest-ranked countries according to land resource potential and constraints are least developed countries. In seven of them, deserts and dry lands occupy more than 95 per cent of total land, which suggests the existence of severe desertification problems.<sup>11</sup> Recurrent droughts further exacerbate these problems by reducing agricultural production and causing food shortages and migration of population.

60. Under the United Nations Convention to Combat Desertification in Countries Experiencing Severe Drought and/or Desertification, particularly in Africa, the affected developing countries that are parties to the Convention were required to prepare National Action Programmes and mainstream sustainable land management in their poverty reduction and national development strategies. The same Convention also established the global mechanism designed to increase financial resources to affected developing countries. As of January 2007, 38 least developed countries had ratified and another 12 least developed countries had acceded to the Convention. Twenty-nine least developed countries have adopted their National Action Programmes and 18 least developed countries received assistance from the

---

<sup>10</sup> Key elements of the enhanced integrated framework include: (a) increased, additional, predictable financial resources to implement Action Matrices; (b) strengthened in-country capacities to manage, implement and monitor the integrated framework process and (c) enhanced integrated framework governance.

<sup>11</sup> *World Soil Resources Report: Land Resource Potential and Constraints at Regional and Country Levels* (FAO, Rome, 2000) (see <ftp://ftp.fao.org/agl/agll/docs/wsr.pdf>).

Global Mechanism in mainstreaming National Action Programmes in poverty reduction and national development strategies.

61. Although least developed countries are the countries which are least responsible for global warming, they are hardest hit by climate change, especially small island States and those in Africa. Recent studies<sup>12</sup> provide compelling evidence that Africa, due to its multiple stresses and low adaptive capacity, is the continent most vulnerable to global warming. Impacts of climate change in Africa include increased water stress, reduced agricultural production, disrupted food supplies and increased malnutrition. The studies also confirm that climate change can affect the local resources of small islands, such as fishery resources, reduce their value as destinations for tourism, cause the deterioration of coastal conditions, lead to coral bleaching, threaten vital infrastructure and reduce fresh water resources, inter alia.

62. The United Nations Framework Convention on Climate Change requires that all Parties adopt national policies and take corresponding measures on the mitigation of climate change. Recognizing the high vulnerability and special needs of least developed countries in adapting to climate change, the same Convention established the Least Developed Countries Fund to provide technical and financial support for the preparation of their National Adaptation Programmes of Action. As of August 2006, 14 least developed countries had completed their National Adaptation Programmes of Action and the remaining least developed countries were expected to complete them in 2007-2008. The Fund has provided financial support to 44 National Adaptation Programmes of Action and two global projects worth \$11.6 million. Four remaining least developed countries (Angola, Equatorial Guinea, Myanmar and Nepal) eligible for National Adaptation Programmes of Action support had yet to submit their proposals for funding and one least developed country had not yet provided information about National Adaptation Programmes of Action preparation. As of 28 April 2006 total available resources of the Fund, including new contributions and pledges, had reached \$89.9 million. Additional pledges have since been made by France and Italy.

#### **Commitment 7** **Mobilizing financial resources**

63. Despite recent pledges, donors are falling behind the target of 0.20 per cent of gross national income/official development assistance by 2010. In 2005, only 6 out of 22 donors met the 0.20 per cent target, down from 7 in 2004, and an additional 1 donor was on track to meet it in 2010, down from 3 in 2004. The remaining 15 donors were far from achieving the target, including 7 with declining or unchanged gross national income/official development assistance. Total net flows of official development assistance to least developed countries continued to increase by 6-9 per cent per year, in line with the goal, but the share of aid to least developed countries in total official development assistance remained unchanged (24 per cent) from 1994-1995 and dropped by 6 percentage points from 2004.

64. Almost all Organization for Economic Cooperation and Development/Development Assistance Committee official development assistance to least

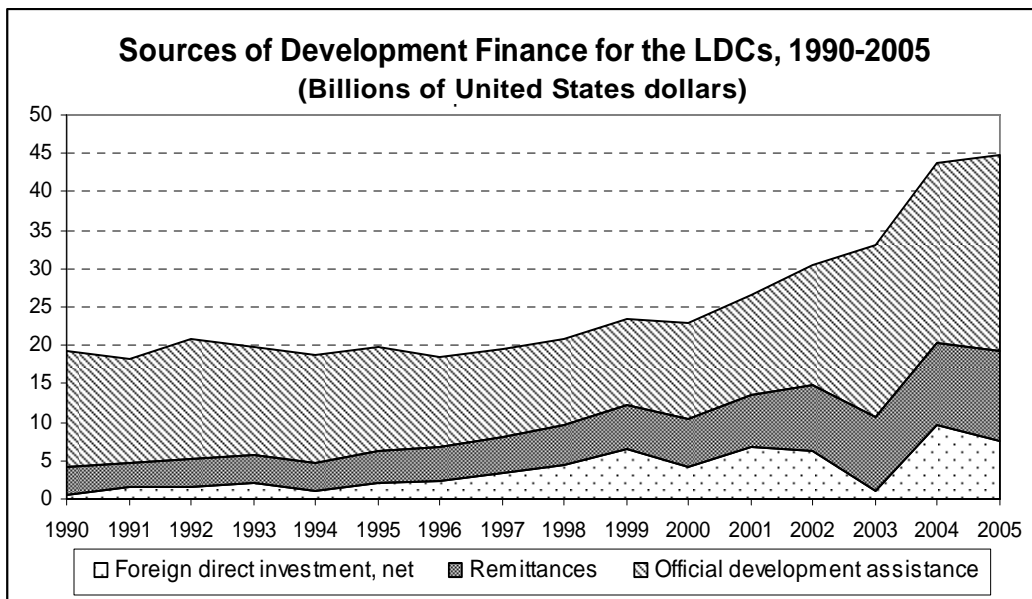

---

<sup>12</sup> See fourth assessment report on global warming prepared by the Intergovernmental Panel on Climate Change; a report entitled "Stern review: the economics of climate change"; and a report on an African regional workshop on adaptation held in Accra from 21 to 23 September 2006.

developed countries was provided in grant form. Furthermore, aid has been untied beyond the coverage of the 2001 Development Assistance Committee recommendation, which excludes food aid and technical cooperation. In addition, the Development Assistance Committee has also abolished the thresholds below which the official development assistance can be untied, encouraging local and regional procurement of goods and services in least developed countries.

65. Donor support for trade relations capacity-building in least developed countries fell by 59 per cent from 2004, even as trade relations capacity-building support from official development assistance to developing countries increased by 12 per cent. From 2004 to 2005, the increase in total trade relations capacity-building was 4 per cent, but the increase to least developed countries was only one half of 1 per cent.

66. Aid allocation by donors was characterized by selectivity and high concentration. Thus, 9 least developed countries accounted for 43.7 per cent of donors aid in 2005. In 14 least developed countries, official development assistance was a significant part of gross national income in 2005. These were largely small island least developed countries with few natural resources, and least developed countries emerging from conflicts, burdened by heavy debt. High (over 20 per cent of gross national income) aid dependency not only makes these countries extremely vulnerable in their development, but also reduces the responsibility of Governments for tax collection and reduces Government accountability to citizens.

67. Delivery of heavily indebted poor countries initiative commitments by the World Bank increased in 2006, from \$1.29 billion early in the year to \$2.80 billion by August, reaching 42 per cent of commitments in terms of net present value. International Monetary Fund delivery, already at 81 per cent in early 2006, increased to 83 per cent, or \$1.22 billion. As a result of debt relief measures, debt service as a percentage of exports has decreased significantly since 1990. Thirty

least developed countries in 2005, compared to 27 in 2004 and only 14 in 1990, had a ratio of debt to exports below 10 per cent. Further, only 2 countries in 2005, compared to 6 in 1990, had debt ratios over 20 per cent.

68. The sharp increase in foreign direct investment in least developed countries observed in 2004 was sustained in 2005 in only a few countries. In 2005, foreign direct investment exceeded 5 per cent of gross domestic product in 11 least developed countries, down from 12 in 2004, and was less than 1 per cent of gross domestic product or negative in 18 countries. In an upward trend since 1990, 15 least developed countries hosted foreign direct investment inflows in the range of 1-4.9 per cent of gross domestic product in 2005.

69. Migrant remittances<sup>13</sup> to least developed countries reached \$11.4 billion in 2005, due entirely to an increase of remittance inflows to Bangladesh. If Bangladesh is not considered, net inflows of remittances to least developed countries remained at exactly the same level (\$10.4 billion) as in 2004. It is noteworthy that South-South remittances exceed North-South remittances to least developed countries, despite high transaction and high foreign exchange commissions at both ends. Income differences, proximity and community ties (ethnic, linguistic, religious, family) with neighbouring developing countries are major determinants of South-South migration which drives remittances in the Bangladesh-India migration corridor, the second largest in the world, as well as remittances from South Africa to Lesotho and Mozambique, from Saudi Arabia to Yemen and Sudan and from India to Nepal. However, higher income difference encourages migration to the North, with such migration resulting in tenfold income increases. The United States of America remains the largest single source of North-South remittances to least developed countries. Significant North-South remittance inflows to least developed countries also originated in the euro area, mainly due to the euro-dollar exchange.<sup>14</sup>

70. In June 2005, at the South-South Summit, Qatar launched the South fund for development and pledged \$20 million to this new financing facility. Though not a donor country, it committed itself to achieving the 0.7 per cent gross national income/official development assistance target to developing countries and the 0.15-0.20 per cent target gross national income/official development assistance to least developed countries by 2006.

### III. Conclusions and recommendations

71. Economic performance of least developed countries continued to improve, and fewer countries, mainly Pacific islands, were lagging behind. Social indicators are also improving, but overall socio-economic progress in African least developed countries has been significantly compromised by continuing population growth due to the highest fertility in the world. International support for health is paying dividends in African least developed countries, but malnutrition appears to be worsening, particularly in rural areas, where agriculture can hardly keep up with rapid population growth, environmental degradation and the challenges associated

---

<sup>13</sup> Migrant remittances are defined as the sum of workers remittances, compensation of employees, and migrants' transfers as recorded in the International Monetary Fund balance of payments.

<sup>14</sup> It is estimated that the appreciation of the euro from US\$ 0.89 per euro in 2001 to US\$ 1.19 per euro in end-2005 accounted for US\$ 5.7 billion or 7 per cent of remittances received by all developing countries in 2001-2005.

with climate change. As a result, African least developed countries increasingly face the danger of food shortages, disruption of food supplies and famine.

72. **Achieving the objectives of the Programme of Action requires greater donor focus on enhancing the productive capacity of least developed countries, in particular in agriculture. Donors also need to increase allocation of aid to physical infrastructure and technological development, as a means of increasing productivity and competitiveness of least developed countries. Above all, donors need to make significant efforts to increase their aid volumes in order to achieve the internationally agreed goal of 0.15-0.20 per cent of their gross national income as official development assistance to least developed countries by 2010 and improve aid effectiveness (ownership, harmonization, alignment, results and mutual accountability), as agreed in Rome and in Paris.**

73. **Developed countries must adhere fully to their commitment of providing duty-free and quota-free market access to all products from least developed countries and trade-related technical assistance, including through Aid for trade and the enhanced integrated framework, aimed at addressing supply-side constraints of least developed countries and mainstreaming trade in their national development plans and poverty reduction strategies. Improving the effectiveness of preferential market access requires improvement of the coverage and predictability of preference schemes and liberalization (simplification, harmonization and relaxation) of rules of origin. Granting the most generous and non-discriminatory treatment to all least developed countries on a lasting and unconditional basis could further boost the utilization of non-reciprocal preference schemes of developed countries. Developing countries could consider (a) granting non-reciprocal preferences to least developed countries and (b) reducing tariffs on all non-agricultural products from least developed countries.**

74. **For their part, least developed countries should strengthen their country ownership by promoting broad-based and inclusive dialogue on development with civil society and the private sector and on effective domestic resource mobilization and aid management, enhanced transparency and accountability, coordination and coherence and outcome-driven implementation, monitoring and evaluation of the implementation of the Brussels Programme at the country level. As they embark, with United Nations Development Programme support, on the preparation of the second generation of poverty reduction strategy papers, the Millennium Development Goals-based national development strategies and new United Nations Development Assistance Frameworks also need to establish synergies at the country level between the Millennium Development Goals, the Brussels Programme and regional initiatives like the New Partnership for Africa's Development, to ensure their complementarity and mutual reinforcement.**

75. **Fighting corruption should become an integral part of the fight against poverty in least developed countries. To be effective, the anti-corruption strategies need to be country-driven and must be viewed in the broader context of good governance. Simplification of procedures, transparency and accountability of decision-making, engaging civil society and a third honest party (domestic or international) which monitors or enforces the law can also**

improve a national system of checks and balances, prevent corruption, improve the delivery of public services and attract investments.

76. Pro-poor policies of least developed countries need to include policies aimed at increasing agriculture and labour productivity. To this end, least developed countries should pursue favourable economic, trade and investment policies and ensure the access of the poor, particularly women, to credit, land and markets. Creating this level playing field is important for promoting competition among suppliers of essential inputs, such as seeds and fertilizers, and creating incentives for private entrepreneurs to invest in agribusiness and for farmers to adopt new and sustainable technology and diversify into higher-value crops which will raise their incomes and help them escape poverty. Elimination of trade-distorting agricultural subsidies and transfer of appropriate agricultural technology and practices by developed countries should complement the efforts of least developed countries.

77. Pro-poor policies of least developed countries should also include sustainable development (construction, rehabilitation and maintenance) of transport infrastructure (rural, national and cross-border). Closing the physical infrastructure divide in least developed countries requires a comprehensive approach to infrastructure development and increased public investments in (a) rural infrastructure, which is important for increasing agricultural productivity and fostering rural growth linkages between agricultural and non-agricultural activities; (b) national transport infrastructure, critical for growth of the formal economy, diversification, structural change and integration into world trade; and (c) cross-border infrastructure, important for regional integration.

78. Improving access to electricity in least developed countries requires overcoming multiple challenges in generation, transmission and distribution at the national level by creating an enabling environment, adopting an effective policy and regulatory framework, improving management capacity and creating financially healthy utilities. It also requires focusing on cost-effective regional supply projects (hydro, coal and gas) and regional integration to promote energy trade. In addition, immediate energy generation solutions and pain relief to mitigate high energy costs must be provided to the most affected least developed countries. Scaling up electricity access in the least developed countries also requires development of a broader multi-year strategy of grid expansion as well as syndicated financing to ensure sustainable and predictable adequate support to the energy sector.

79. Bridging the digital divide between least developed countries and the rest of the world requires that policymakers, regulators, telephone operators and service providers adapt to the new challenges and opportunities offered by information and communications technology. Pricing is a critical factor in narrowing the digital gap. New technology, privatization and competition can reduce price, but they need an effective, transparent and predictable regulatory framework that would create a favourable investment climate, promote market opportunities and facilitate the realization of the full benefits of information and communications technology in the interest of the poor. To involve the private sector in deployment of information and communications technology in remote, rural areas sufficient incentives such as tax breaks, waivers of customs

**duties on information and communications technology equipment, easy access to universal service funds, etc., are required.**

**80. Attracting more foreign direct investment to least developed countries requires (a) further improvement of their business and investment climate and public administration, (b) mitigation of their non-commercial risks, (c) entry of least developed countries into aid-supported regional and subregional currency arrangements, (d) adoption of targeted investment promotion strategies, and (e) basic necessary infrastructure. Identifying new niches beyond traditional areas (oil, gas and minerals) and former colonial markets (e.g., tourism, information and communications technology-based industries and services, etc.) is also an important element of successful foreign investment strategy for least developed countries.**

**81. South-South cooperation holds great potential for poverty reduction in least developed countries and should be further nurtured. Experience shows that cooperation between countries with similar conditions (environment, culture, economy) often results in the transfer of more appropriate technology. When the cooperation takes place between neighbouring countries, operating (personnel, transportation, etc.) costs are significantly reduced. South-South aid assistance expands aid uses and increases overall aid resources. As is the case with North-South investments, South-South investments can increase productivity and tax revenues. However, South-South cooperation should be viewed not as an alternative but rather as a valuable complement to North-South cooperation.**

Sources: United Nations Educational, Scientific and Cultural Organization, *Education for All, EFA Global Monitoring Report 2007—Strong Foundations, Early Childhood Care and Education* (Paris, 2007), tables 12 and 13. Data refer to the latest year available in the period 2000-2004. Where primary data are not available, UNESCO relies on national and international estimates; gender ratios for 1990-1991 from United Nations Statistics Division, *Millennium Indicators Database*, indicator 9 (accessed 1 February 2006).

\*A negative (-) sign indicates a decrease in gender difference; a positive (+) sign indicates an increase.
